Therefore the development of effective methods of qualitative analysis of multi-dimensional dynamical systems and their application to the problems of astrophysics and gas dynamics previously unsolved by traditional methods becomes especially urgent.

There are many interesting mathematical problems in control theory. In this paper we will discuss problems and techniques related to underactuated systems. An underactuated system is one with fewer control inputs than degrees of freedom. Balancing a ruler on the tip of a finger is a good example of an underactuated system.

A flat cosmological model in the bimetric scalar-tensor ...

We apply the methods of the qualitative theory of dynamical systems to study a flat cosmological model of the bimetric scalar-tensor theory (BSTT) of gravitation with the equation of state  $p = a \cdot \rho - a \cdot 1$ . We single out the basic classes of solutions and study their behavior in different limiting cases.
